Sangavi C

Software Engineer – Generative AI & Agentic Systems

Bengaluru, India | +91-7010846735 | sangavikavic@gmail.com
linkedin.com/in/sangavi-c | github.com/sangavikavi | Portfolio

Technical Skills

GenAI & Agents: Google ADK, LangGraph, LangChain, MCP, A2A, multi-agent orchestration, RAG, prompt engineering, LLM evaluation (LLM-as-judge), human-in-the-loop

LLM Platforms: AWS Bedrock, GCP Vertex AI, Claude, Gemini, pgvector

Backend: Python, FastAPI, REST, GraphQL, PostgreSQL, DynamoDB, Kafka

Frontend: React, Angular, TypeScript, JavaScript

Cloud & Tools: AWS (Lambda, DynamoDB), GCP, Docker, CI/CD, Git, Claude Code, GitHub Copilot

Experience

HashedIn by Deloitte Jun 2024 – Present
Software Development Engineer – AI *Bengaluru, India*

Regulatory Intelligence Platform *Google ADK, Python, FastAPI, React, PostgreSQL*

- Architected a multi-agent platform on **Google ADK** that automates the full regulatory intelligence cycle – discovering new regulations, assessing compliance gaps, scoring risk and estimating business impact – across 40+ regulatory sources, cutting analysts' manual effort by **95%** (from days → hours per assessment).
- Split the workflow into specialised agents (**Discovery, Compliance Analysis, Risk Scoring, Impact Evaluation**) coordinated by an orchestrator agent, so each agent has a narrow prompt, its own tools and a structured output schema; answers are grounded with **RAG** so every finding cites its source clause.
- Built a dedicated **QA agent** (LLM-as-judge) that checks every generated finding against its cited text and sends unsupported claims back for regeneration before analysts see them, raising answer accuracy from 78% to 94% on a 300-case evaluation set.
- Led a team of 5 engineers through design, build and rollout – breaking down work, reviewing code and owning the agent architecture – replacing an analyst-run manual workflow and reducing turnaround from 5 days to 6 hours.

Agentic Vendor Management Platform *Agents, BambooHR API, FastAPI, Angular*

- Built a set of AI agents that run the vendor and employee-expense back office end to end: **invoice review**, **expense submission**, **approvals**, **BambooHR timesheets**, **trip planning** and **reimbursements**.
- Invoice agent checks vendor line items against agreed terms and flags mismatches; expense agents validate receipts against policy; a **BambooHR** integration lets agents submit timesheets for employees.
- Added **human-in-the-loop** approval gates on every step that moves money or changes records, with an approval UI where managers can review the agent's reasoning, then approve, edit or reject.
- Now handles 2,000+ requests per month and cut processing time by 70%.

Distributed Multi-Agent Control Plane *AWS Bedrock, DynamoDB, Kafka, MCP, A2A, Lambda*

- Designed the shared infrastructure that lets agents built by different teams find and call each other: an **Agent-to-Agent (A2A)** service-discovery layer and an **MCP** tool registry, both stored in **AWS DynamoDB**.

– Routed domain events through **Kafka** to invoke **AWS Bedrock** agent runtimes asynchronously, so long-running agent tasks no longer block the calling service or time out.

– Added retries and failure handling around agent invocations, **cutting agent task failure rates by 30%**.

Full-Stack Engineering & Delivery *React, Angular, FastAPI, REST, GraphQL, PostgreSQL*

– Built the **FastAPI** back ends (REST and GraphQL APIs on **PostgreSQL**) and **React/Angular** front ends that put these agents in front of users, including streamed agent responses, citation views and approval screens; used Claude Code and GitHub Copilot with unit tests and code reviews.

Certifications & Awards

- Claude Certified Architect – Foundations — Anthropic
- Google Cloud Professional Cloud Architect; Build with Vertex AI – Technical Expert — Google Cloud
- Excellence Award (3×) for delivery — HashedIn by Deloitte

Projects

Multi-Agent Software Engineering Platform | *LangGraph, pgvector, Docker* GitHub

– Planner, developer, reviewer and tester agents orchestrated in LangGraph take a GitHub issue, edit code in a Docker sandbox, run the test suite and open a pull request only after human approval.

– Retrieval over a pgvector index of the repository grounds each change; resolved 32 of 50 test issues end to end and cut issue-to-PR time by **60%** versus manual work.

AI Codebase Analysis Platform | *LangChain, FastAPI, React* GitHub

– Indexes a GitHub repository into embeddings, then uses agents to map architecture, generate documentation and answer natural-language code-search queries with file-level citations.

– Cut manual code-review and onboarding time by **40%** across 15 repositories (500k+ lines of code).

Education

V.S.B. Engineering College, Karur 2020 – 2024
B.E., Computer Science and Engineering – 87%
